Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that Mitra et al. and Rozzi et al. do not meet the required limitation of having a second repeating unit that comprises a polarizable group which is different from the first repeating unit. The applicants argue that the second repeating unit cited by the examiner, "branched or cyclic alcohols" was in fact used to produce the repeating unit and is not a monomer on its own. The examiner agrees, but points to Mitra et al. which teaches that the monomer of Unit A is derived from vinylic monomers such as acrylates, methacrylates, crotonates, itaconates and the like (column 3, lines 44-47). Unit B is derived from acrylate or methacrylate or "other" vinyl polymerizable starting monomers, inlcuding styrene, vinyl chloride, vinylidene chloride, acryloyl monomers and the like (column 5, lines 10-20). Both unit A and unit B have several possible monomers which would produce different repeating groups, i.e. Unit A with an acrylate monomer and Unit B with a stryene monomer. The examiner also points to Rozzi et al. which teaches that the monomer of Unit A is derived from vinylic monomers such as acrylates, methacrylates, crotonates, itaconates and the like (column 2, lines 64-66). Unit B is derived from acrylate or methacrylate or "other" vinyl polymerizable starting monomers, inlcuding styrene, vinyl chloride, vinylidene chloride, acryloyl monomers and the like (column 4, lines 30-40). Both unit A and unit B have several possible monomers which would produce different repeating groups, i.e. Unit A with an acrylate monomer and Unit B with a stryene monomer.
